

Group 11:
Prototype A:

- The user wanted to create a new entry within the day overview screen and did not notice the “+” button on the bottom of the screen. It seemed more natural for the user to first click on the day for which to create a new entry and then add a new event.
- The user wanted to play around with all buttons and see what they do. There was a bit of confusion due to missing functionality
- The user asked about how to add new friends to events. It did not seem clear enough how to add them to events.
- Template feature found to be nicely done and easily used
- Creating events from scratch and using templates is clearly distinguished
- Monthly overview most important
- Open events are helpful if not all details are already known. The user likes the possibility to then chat with others about missing details.
- The daily overview should rather be illustrated from top to bottom instead of horizontally
- According to the user, prototype A was the preferred choice

Prototype B:

- Would not use app for personal events, but would use for professional endeavors
- Likes to have a shared interface for group and personal events
- Likes the friends/contacts list, but prefers the interfaces of P1 (different overviews)
 - A combination of both approaches would be optimal

Group 16:
Prototype A:

- The “+” button for creating new entries was immediately found and used
- Template usage seems very intuitive and easy
- Nice to have everything on one screen when creating new entry
- The user had the natural tendency to use the “create from scratch” button when wanting to create a new template
- Upcoming events tab is helpful in seeing what events are around the corner
- The user finds it important to have all different overviews
- When creating an open event, the user finds it more intuitive to set a range of dates or an entire day in case the time is not exactly known beforehand
 - Most of the times people have a hunch in regards to possible dates or time slots for events
 - With a range of dates the open event can be displayed on the upcoming events page
- User likes the open events tab

- According to the user, prototype A was the preferred choice

Prototype B:

- Would use the function to create group events
 - Unsure if people are too lazy to fill out their calendar
- Has no fixed times for planning events like evening out usually
 - A buffer time would be optimal
- Would like to have a shared interface for group and personal events

Group 19:

Prototype A:

- The “+” button for creating new entries was immediately found and used
- User did not use template functionality when instructed to create a specific event
- Once the Template functionality was spotted it was very easy and saved time
- The screen to edit or create events feels a bit bloated. The user doesn’t mind to scroll
- Calendar picker and time range picker should be vertically stacked instead of horizontally
- Some remarks on open events:
 - The user likes the functionality
 - Feature suggestion: The app should check for possible overlaps of time schedules among participants and, hence, automate time selection
 - Open events get the ball rolling when it comes to events among friends. Otherwise some events get simply forgotten
 - Add participants to open events via link was suggested
 - Doesn’t want to use in-app chat since there are already other messaging apps
- In the user’s opinion, there are too many calendar overviews (less would be better). The weekly overview is preferred and the timeline should go from top to bottom
- Upcoming events page could be too bloated for users that have many events each week

Prototype B:

- Select time slots with scroll function is a necessary function
- Cannot find where to create a group event without telling (unintuitive?)
- Creating group events takes too long. Hence creating a group event has to be fast.
- Group same themed button on the screen e.g. left hand side all the social button like chats, profile and on the right hand side all the event creating buttons
- Interact with people that use a different calendar app would be helpful
- Remove “create group invent” from Invites menu options.

- Our app is less intuitive compared to prototype A. The user wants to have different overview of the calendars
- The user likes simple design
- Unified view of personal and group calendar

TA:

Prototype A:

- The “+” button for creating new entries was immediately found and used
- Remarks on the page where users edit entries:
 - The calendar should be bigger and the page should be scrollable instead of cramming everything into one frame
 - Functionality to add exact time missing
- Nice to use template for recurring events
- There is no page to edit existing templates
- Calendar overviews should be togglable (i.e. switching between daily, weekly and monthly screens) on the same page and not be accessible in a separate sidebar
- Would be nice to make a distinction between events created by oneself and by others. In other words, make it obvious who the event admin is.
- Make chat functionality visible for already existing events
- Likes prototype A better design-wise and finds it more interesting
- A template overview screen should be a separate item in the sidebar

Prototype B:

- Option to select a specific start / end time (not just dragging)
- Immediate notification (eg 5 friends already selected their times)
- Add back buttons
